

FormID Formatting

FormIDs can be formatted in several ways. First let's look at the possible layouts.

- Layout 1 - A List style layout that supports optional comments, it is important to make sure there are no commas ',' in the comments as that will interfere with the built in parser and potentially crash the game. Please make a note of the '<<<LIST' tag, this is used to tell Completionist where the list starts, and then again without the '<<<' to tell Completionist where the list ends.

```
FormIDs = <<<List
0x89EBB8,           ;Ancient Nord Buckler
0x17E91C,           ;Athir's Armor
0x1EA7E5,           ;Chef's Hat
0x17E919,           ;Daenlit's Armor
List
```

- Layout 2 - The same as above but with no comments.

```
FormIDs = <<<List
0x89EBB8,
0x17E91C,
0x1EA7E5,
0x17E919,
List
```

- Layout 3 - Simple string style, all on one line separated and ending with a comma ",".

```
FormIDs = 0x89EBB8,0x17E91C,0x1EA7E5,0x17E919,
```

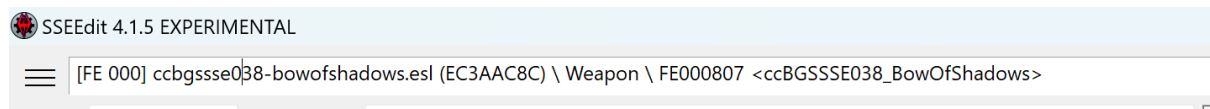

With layouts out of the way, let's look at the formID's themselves and how Completionist will read and parse them. Completionist requires formID's to be in a 'raw' state, meaning that load order should not be included in the formID.

Let's look at this formID for the Bow of Shadows in SSEEdit. We can see that the formID is split into 2 parts, the load order **FE000** and then the formID **807**. All we have to do to convert it into its raw state is replace the load order with **0x**.

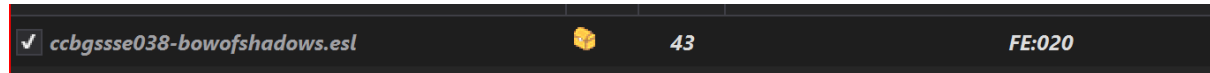

Static		
Weapon		
FE000807	ccBGSSSE038_BowOfShadows	Bow of Shadows

So in this case **FE000807** becomes **0x807**, this is optional but I like to make sure the formID is the same length as it was before, so I would replace **FE000** with **0x000** making the new formID **0x000807**.

If you are unsure about what the load order is, you can select the entry in SSEEdit then look at the top bar. The first part is your load order **[FE 000]**

You can also look in MO2 at the plugins tab on the right hand side of the plugin name.

OK! So you know how to build the list and you also know how to convert your formID's for the things you want to add tracking for. The final thing about formID's comes down to what your patch is actually doing.

Each .ini file has the following variable in the **[Completionist Patch Data]** section.

```
PluginFileName = Some File Name.esp
```

This file name tells completionist which plugin the formID's are coming from, pretty simple stuff if your only tracking things from one mod, but if you want to track things from different mods all in the same page then you need to go an extra step and tell Completionist which plugin the formID is coming from in the actual **FormIDs** list. To do this we simple append ***FileName.esp** to the end of the formID, here are a couple of examples of how it looks.

```
Completionist_Patch - Read
FormIDs = <<<List
0x01579F*HearthFires.esm,           ;Lakeview Manor Charter
0x0157A0*HearthFires.esm,           ;Windstad Manor Charter
List
Completionist_Patch - Write
FormIDs = 0x163A53*Wormstooth.esp, 0x163A54*Wormstooth.esp, 0x163A55*Wormstooth.esp,
```

Ideally you would want to have the **PluginFileName** be the name of the mod where most of your formID's are coming from then you can add the other ones you need like the examples above.

Conditional formIDs

Completionist supports several ways of conditioning formID's for several use cases. Let's look at them here and deep dive into how it works.

1. 0x000800<!SomeFileName.esp
Tell completionist to only install this formID if the plugin name after <! is missing from the load order.
2. 0x000800<&SomeFileName.esp
Tell completionist to only install this formID if the plugin name after <& is installed in the load order.

3. 0x000800*SomeFileName1.esp<!SomeFileName2.esp
Tell completionist to install this formID from another plugin if the plugin name after <! is missing from the load order.
4. 0x000800*SomeFileName1.esp<&SomeFileName2.esp
Tell completionist to install this formID from another plugin if the plugin name after <& is installed in the load order.

A perfect example for why the above could be needed is the mod Undeath. Undeath has a spell tome with a formID of **0x05839E** but if you also have 'Undeath Classical Lichdom' installed then the spell tome is no longer available as it is removed by the mod.

Item Variations

Skyrim has a lot of instances where an item has several variations, it could be a levelled item or the same item with different enchantments, it could even be like miraak's robes that have 13 different variations with 1h, 2h, light and heavy options.

Completionist will not automatically know about these variations as you are only giving it one formID per tracked item.

Take the **Amulet of Articulation** for example, there are 7 different playable versions of this amulet, if you collect one at a low level, later on in your game your going to come across it again maybe and it will not show as collected as its now a different level and a completely different item.

0009DFF7	TGAmuletofArticulation01	Amulet of Articulation
- 000F6904	TGAmuletofArticulation02	Amulet of Articulation
- 000F690D	TGAmuletofArticulation03	Amulet of Articulation
- 000F690E	TGAmuletofArticulation04	Amulet of Articulation
- 000F690F	TGAmuletofArticulation05	Amulet of Articulation
- 000F6910	TGAmuletofArticulation06	Amulet of Articulation
- 000F6911	TGAmuletofArticulation07	Amulet of Articulation
- 000FDEAF	TGAmuletofArticulationNPCVersion	Amulet of Articulation

To get around this problem, you can use the formID of the item as a **"Key"** for the formID's of all the different variations. Now when you collect one, it will register them all as collected. Note that variations are a simple string layout and do not support the list style above.

0x009DFF7 = 0x0F6904*Skyrim.esm,0x0F690D*Skyrim.esm,0x0F690E*Skyrim.esm,0x0F690F*Skyrim.esm,0x0F6910*Skyrim.esm,0x0F6911*Skyrim.esm,

So all together it would look like this, however please only use one layout per section, you can also add as many variations as you like, there is no limit to them.

And that's all there is to it!

Good luck and happy modding!

Faen 😊
